Abstract
The main objective of this research study was to identify the research gaps in organizational conflicts. Researcher has utilized desk research study to identify three research gaps in organizational conflicts. First research gap can be labeled as there is less empirical evidence on the relationship between organizational conflicts in Sri Lankan and Asian context. Second research gap in this article is known as more studies to analyze the links between organizational conflicts and other affective variables. Third research gap is requirement for more longitudinal studies on organizational conflicts. These research gaps can be utilized by future researchers to conduct their studies on organizational conflicts.

Keywords: organizational conflicts, task conflicts, relationship conflicts, research gaps

1. Introduction
The concept of organizational conflicts empowered from many academic disciplines. According to Rahim (2001) psychology and philosophy contributed more for organizational conflicts subject area. Organizational conflicts included major theme of occupational psychology/social psychology as well as organizational behavior (De Dreu, 2008). There is less contribution from science for the developing organizational conflicts subject area. In present context, organizational conflicts are discussed in human resource management and organizational behavior.
2. Methodology

Main objective of this study is to identify research gaps of organizational conflicts. Desk research study method is adopted to achieve the main research objective of this study. Several recognized databases were used to access research articles, such as Sage, Emerald, JSTOR, ScienceDirect and Google Scholar etc. Also researcher used other published books to achieve the research objective of the study.

3. Literature Review

3.1 Organizational Conflicts

There are many academic disciplines contributed for the study of organizational conflicts. According to Rahim (2001) psychology and philosophy contributed more for organizational conflicts subject area. Organizational conflicts included major theme of occupational psychology/social psychology as well as organizational behavior (De Dreu, 2008). There is less contribution from science for the developing organizational conflicts subject area. In present context, organizational conflicts are discussed in human resource management and organizational behavior. In addition from theoretical importance, organizational conflicts are important in practical scenario. Contemporary organizations are unable to avoid conflicts in the workplace. And there is no organization without a minor organizational conflict. When there are two parties dealing with any situation, there is a chance for organizational conflicts. Two individual, two groups or organizational units, two organizations and two nations can be included in the major parties in conflicts. It means that organizational conflicts are inevitable situation in any organization.

3.1.1 Definition of Organizational Conflicts

There is no clear definition or universally accepted definition for conflicts as different authors defined conflicts in different ways. This is an attempt to identify several definitions of conflicts/ Organizational conflicts and understand important terms in those definitions.

Conflicts can be defined as interactive process that began manifested in incompatibility, disagreement or dissonance within or between individuals, groups, organizations or any other social entity (Rahim, 2001). According to Opatha (2015) definition, conflicts as a disagreement at least between two persons or parties with relevant to important thing which is an interesting thing to both parties. Same author mentioned that conflict can be referred as dispute, fight, struggle or turmoil as well. Afzal (2009) defined conflicts as any disagreement between two or more persons, groups, nations and countries. Finally, Robbins and Judge (2013) stated that conflict is a process that begins when one party perceives that another party has negatively affected, or is about to negatively affects, something that the first party cares about.

Organizational conflicts can be defined as a situation occurs when one employee perceives that his or her interests are negatively affected by another party (Aquino, 2000). Also organizational conflict can be defined as any interaction between workers and clusters with irreconcilable differences or not compatible characters (Rahim, 2001).
and Callister (1995) organizational conflicts can be explained as a situation when individual or group perceives that its goals, values or opinions are being spoiled by interdependent counterpart. Kumar (2009) defined organizational conflicts as a behavior demonstrated by organizational members which is expended in opposition to other members. Same description given by Roloff (1987) for the organizational conflicts. According to him, organizational conflicts incurred when members engage in activities that are incompatible with the other party who utilize the products and services of the organization.

Based on the critical analysis of those above mentioned definitions, common elements can be identified with regard to definition of organizational conflicts. Organizational conflicts are involved with perceptions and beliefs, organizational conflicts can be derived between two individual, groups, departments or two organizations. One Party or both parties interest negatively affected. Rahim (2001) has identified the overlapping areas of most recent definitions of conflicts which are compatible with the researcher’s findings. Those are

- Conflicts prevent someone from achieving their goals
- Conflicts linked with beliefs
- Conflicts include opposing interests between individuals and goals.
- Conflicts is a process which has series of steps

3.2 Reasons for Organizational Conflicts

As researcher’s interest is on organizational conflicts, this section focuses on the reasons or causes for organizational conflicts. According to De Dreu and Gelfand (2007) organizational conflicts can be occurred due to scarcity of productive resources (time, financial budgets, status etc.), values and beliefs of the employees (moral values, religious beliefs and political preferences) or because of insights facts. Organizational conflicts can be aroused when there is an incompatibility, dissatisfaction, arguments, interdependence and mismatch between preferences, values, goals and attitudes between employees in the organization (Cheong and Kim, 2017). On other hand, Robbins and Judge (2013) there are several reasons for organizational conflicts such as communicational issues (inadequate information, semantic differences and differences of backgrounds) and structural issues (goal incompatibility, ambiguity in authority and issues in leadership style) and personal factors (values, beliefs, attitudes and personality issues). Aswathappa and Ready (2009) identified several reasons (sources) for organizational conflicts as inadequate communication, incompatible personalities, unclear job boundaries, unclear policies, unrealistic deadlines and organizational complexities etc.

Sri Lankan organizational behavior researcher Opatha (2015) presented more appropriate classification for the reason for organizational conflicts. According to him, all the reasons for organizational conflicts can be categorized in to two main groups; they are organizational causes and personal reasons. Organizational reasons occurred due to issues in organizational structure and personal reasons can be occurred from the differences among employees. The examples for organizational reasons are competition for scarce resources, goal differences,
role differences, ambiguous jurisdictions (unclear responsibilities), status differences, dependence of one party, overspecialization. The examples for personal causes are perceptions, domination, greed or avarice, unwillingness to communicate, rudeness and incivility. Causes of conflicts can be visualized by the following diagram.

<table>

### 3.3 Perspectives / Views of Organizational Conflicts

Based on the extensive literature review, there are three perspectives or three views of organizational conflicts can be identified. As per traditional perspective, organizational conflicts must be avoided. Later organizational conflicts viewed as natural and not as negative, which has positive to increase the performance of the organization. Finally, researchers have viewed conflicts as a positive force to develop healthy relationships in the organization and perform effectively (Afzal et al., 2009). Robbins and Judge (2013) identified three perspectives of conflicts which are known as traditional view of conflicts, interactionist view of conflicts and resolution focused view of conflicts. According to them, traditional view of conflicts believed that conflicts are harmful to the organizations and must be eliminated. According to interactionist view, conflicts can be treated as a positive force as well there is a necessity to eliminate the conflicts. Robbins and Judge (2013) mentioned that resolution based view of conflict recognized conflicts are inevitable in the organization and organization should focus on more productive conflict resolution.
Another schools of thought explored that there are three perspectives of organizational conflicts (Vokic and Sontor, 2009). They are known as traditional perspective, behavioral perspective and interactionist perspective. Kumar (2009) identified two view conflicts instead of three views. Those are classical view of conflicts and modern view of conflicts, classical view pointed out conflicts are bad and must be avoided at any cost. Modern view of conflicts categorized functional conflicts (those are supported for group performance and organizational performance) and dysfunctional conflicts (those conflicts hinders the group performance and organizational performance). Functional conflicts and dysfunctional conflicts described as follows.

3.4 Functional and Dysfunctional Conflicts

Based on the perspectives of conflicts, organizational conflicts can be viewed as two sides of one coin, first side can be taken as functional conflicts. Functional conflicts described as conflicts or disagreement between individuals and groups which support for the achievement of organizational goals and those conflicts helps to increase organizational performance as well as job performance (Opatha, 2015). Kumar (2009) described functional conflicts as confrontation of two different ideas, goals or individuals that help to increase employee performance and organizational performance. Functional conflicts refers as conflicts which supports for the goals of the group and supports for the improvement of the performance of the group (Robbins and Judge, 2013). Opatha (2015) identified the positive consequences from functional conflicts as follows. Functional conflicts leads to new ideas and creativity, also those conflicts can lead for new solutions to the problems in the group, those conflicts helps to energize the group members and functional conflicts provide learning opportunity to the group members as well. Kumar (2009) also presented the similar positive consequences of functional conflicts. For example, functional conflicts give second opportunity to the employees to think about the existing situation, it leads to innovation and new direction to the organization and employees can find search behavior due to functional conflicts.

The other side of coin is dysfunctional conflicts. Dysfunctional conflicts can defined as conflicts or disagreement between individuals and groups which do not support for the achievement of organizational goals and those conflicts do not help to increase organizational performance as well as job performance (Opatha, 2015). Kumar (2009) described dysfunctional conflicts as confrontation of two different ideas, goals or individuals that hinders employee performance and organizational performance. Dysfunctional conflicts refers as conflicts which are not supportive for the goals of the group and not supportive for the improvement of the performance of the group (Robbins and Judge, 2013). Opatha (2015) explained the negative consequences of dysfunctional conflicts such as it threatens psychological well-being of employees, it wastes resources, it creates negative climate and it increases hostility and aggressive behaviors of employees. Kumar (2009) mentioned the negative consequences of conflicts or results of dysfunctional conflicts. Those are, dysfunctional conflicts always harmful to the organization because people work against organizational objectives, also it creates distrust and suspicion of the minds of employees, those dysfunctional conflicts create dissatisfaction, low morale, increased labour turnover and decreased productivity. Also it yields less cooperation in future as well.
This study is an attempt to investigate the relationship of employees’ intention to leave from the organization and organizational conflicts which created as a result of dysfunctional conflicts.

3.5 Levels of Organizational Conflicts / Types of Organizational Conflicts

Based on literature review from organizational behavior and human resource management, various types and levels of organizational conflicts can be identified. But various authors classified organizational conflicts into different ways. For example, Rahim (2001) classified organizational conflicts into two main levels as intra-organizational conflicts and interorganizational conflicts. Further he has classified intra-organizational conflicts into intrapersonal conflicts, interpersonal conflicts, intragroup conflicts and intergroup conflicts. Kumar (2009) identified four levels of organizational conflicts, namely as intra-individual, interpersonal conflict, inter group conflicts, intra-individual conflicts. Aswathappa and Reddy (2008) presented similar classification for levels of conflicts as intra-individual, interpersonal conflict; inter group conflicts, intra-groups conflicts.

3.5.1 Intrapersonal Conflicts and Interpersonal Conflicts

As per mostly commonly use classification by Rahim (2001), intra-organizational conflict refers as conflicts within the organization and inter-organizational conflicts refers as the conflicts between two different organizations. Further, intra-organizational conflicts into intrapersonal conflicts, interpersonal conflicts, intragroup conflicts and inter group conflicts. Same author described intrapersonal conflicts occurs when individual is unable perform role which does not match with his or her expertise and skills. Interpersonal conflicts occurs between two employees in the same organization.

3.5.2 Intragroup Conflicts

Rahim (2001) defined intragroup conflicts as conflicts among two sub groups in the same organization and it is known as interdepartmental conflicts. Intra-group conflicts refer to conflicts which occur within organization, departments to departments, branch with another branch and employee to employee (Anwar et al., 2012). Second definition is different from Rahim (2001) definition. Jehn (1995) identified two types of intragroup conflicts as task conflicts and relationship conflicts. Later, Jehn and Mannix (2001) and De Dreu and Weingart (2003) identified three types of intragroup conflicts as task conflicts, relationship conflicts and process conflicts.

There are three types of intra-group conflicts including task conflicts, relationship conflicts and process conflicts. Task conflicts can be defined as disagreements of view with regard to the task of team (Jehn and Chatman, 2000). Also Jehn (1994) described task conflicts as conflicts of ideas about the content and issues of the task. Riaz and Junaid (2014) mentioned alternative terms for task conflicts as cognitive conflicts and substantive conflicts.

Second type of intragroup conflict is relationship conflicts which known as affective conflicts and emotional conflicts (Riaz and Junaid, 2014). Relationship conflicts can be defined as awareness of individuals about the incompatibilities which include affective components of...
individuals (Jehn and Mannix, 2001). In other word, Jehn (1995) defined as differences among group members in personal concerns.

Latest addition to intragroup conflicts is process conflicts. Process conflicts can be defined as awareness of controversies about aspects of how task accomplishment will proceed (Jehn and Mannix, 2001). Jehn and Mannix (2001) mentioned that process conflicts can be occurred due to issues of duty and resource delegation.

3.5.3 Intergroup Conflicts

According Rahim (2001), intergroup conflicts can be referred as conflicts between two departments or two organizational units in the same organization. This type of conflict is also known as interdepartmental conflicts.

3.5.4 Inter-Organizational Conflicts

According Rahim (2001), inter-organizational conflicts can be referred as conflicts between two different organizations. As present study limited to one organization, inter-organizational conflicts are not focused in the present study. Researcher assumed that inter-organizational conflicts are not influenced for employees’ intention to leave.

3.6 Key Studies on Organizational Conflicts

There are several key studies on organizational / workplace conflicts which are presented in Table 1.

Table 1. Key Studies on Organizational Conflicts

3.7 Identified Gaps in the Literature of Organizational Conflicts

Based on the comprehensive literature review and based on the previous studies of organizational conflicts, following research gaps were identified by the researcher.

**Gap 01: There is less empirical evidence on the relationship between organizational conflicts in Sri Lankan and Asian context.**

Riaz and Junaid (2013) stated that majority of studies of organizational conflicts were conducted in North America or Western countries (individualized countries), less studies were conducted in Asian countries (collectivist countries). In Sri Lankan context, Shanthakumary (2012) found that there is a negative relationship between relationship conflict and job satisfaction and positive relationship between relationship conflict and propensity to leave. It does not support to generalize the findings from North American countries or Western countries. There should be more studies to be conduct to test the association empirically and to generalize the findings from western countries to Asian countries.

Lu et al., (2011) conducted a study to investigate the effects of task and relationship conflicts on individual work behaviors by using one hundred sixty six pairs of supervisors and subordinates of China. Same authors suggested the need of conducting more research studies in Asian countries and Western countries to check the influence of cultural factors on organizational conflicts. Collectivist countries tend to favor for cooperation and try to avoid conflicts than individualist countries (Hofstede, 2001). Tjosvold and Yu (2007) stated that Asian people like to believe that conflicts lead to decreased performance. Although several scholars have emphasized the importance of studying cultural influence on organizational conflicts, it has not been empirically tested in Sri Lankan /Asian context.

Another study was conducted by Chun and Choi (2014) to investigate the relationships between psychological needs of group members, intragroup conflict, and group performance. This study was conducted by using one hundred forty five (145) work teams in sixty three (63) Korean organizations. Chun and Choi (2014) study was based on Korean organizations which come under the collectivist countries. Same authors suggested that more studies from collectivist countries/ Asian countries should be conducted on organizational conflicts/ intragroup conflicts in order to generalize the findings. All these empirical evidence proved that there is less empirical evidence on the relationship between organizational conflicts and other employee related variables in Sri Lankan and Asian context.

**Gap 02: More studies to analyze the links between organizational conflicts and other affective variables**

De Dreu and Weingart (2003) studied about the association between relationship conflicts, task conflicts, team performance and team member satisfaction. Same authors identified that satisfaction is related to absenteeism, turnover and organizational citizenship behavior and assumed that relationship conflicts are more than task conflicts affects to absenteeism, turnover and organizational citizenship behavior. Medina et al., (2005) conducted a study to evaluate the link between task conflicts and relationship conflicts and their influence on employees’ affective reactions (satisfaction, wellbeing and propensity to leave). Same authors
recommended that future research should study more about the relationship between types of conflicts and other affective variables.

**Gap 03: More longitudinal studies on organizational conflicts**

Most of previous researchers emphasized that there should be more empirical research studies in future in order to present more strong causal conclusions. Most of previous research studies were conducted as cross sectional studies, except few studies (Jehn and Mannix Study, 2001; Tekleab et al., 2009; Hill et al., 2015; Lira et al., 2008; Gamero et al., 2008 etc.) . There are several researchers pointed out that there should be more longitudinal studies in future. For example Medina et al., (2005) pointed out that task conflicts may be transformed to relationship conflicts in the future which can be counterproductive. Therefore, same researchers suggested that more longitudinal studies required to test the transformation of task conflicts into relationship conflicts. Mooney et al., (2007) presented similar idea. They stated that cognitive conflicts (task conflicts) ignites to affective conflicts (relationship conflicts) future longitudinal studies needed to analyze the transformation of cognitive conflicts (task conflicts) to affective conflicts (relationship conflicts).

Frone (2000) conducted a cross sectional study on interpersonal conflicts at work and psychological outcomes (job satisfaction, organizational commitment and turnover intentions) of young workers and suggested that future longitudinal studies are needed to draw strong causal conclusions on interpersonal conflicts at work and psychological outcomes.

All these empirical evidence proved that there should be more longitudinal studies on organizational conflicts.

**4. Conclusion**

As mentioned above, organizational conflict is an interesting research area in organizational behavior, human resource management and organizational psychology. The main objective of this study is to explore the research gaps in organizational conflicts with the support of comprehensive literature review. Researcher identified three research gaps which can be categorized as empirical gaps and theoretical gaps. Research gap 1 and research gap 3 in this article can be categorized in to empirical gaps in organizational conflicts research area. Research gap 2 in this article can be categorized in to the theoretical gap. This research paper provides useful insights to future researchers to conduct their studies on organizational conflicts.
